

Moab

Why is Moab appending qlist to a user via the IDCFG when it should be overwriting?

Issue: Moab is appending qlist to a user via the IDCFG when it should be overwriting.

Symptom:

Moab supports an identity manager via the IDCFG line where a flat text file or script use used to feed in user credential information to Moab. In such a case where the credential is:

```
user:john QLIST=test1
```

and it later changed to

```
user:john QLIST=test2
```

Moab appends the QLIST to the user credential via mdiag -u.

Solution:

Moab requires both the QDEF and QLIST to be set at once in the identity manager.

So to get the desired behavior first set:

```
user:jbooth QDEF=test1 QLIST=test1
```

Then to change set to both QDEF and QLIST in the identity manager.

```
user:jbooth QDEF=test2 QLIST=test2
```

Unique solution ID: #1056
