## Moab

## Why is Moab appending qlist to a user via the IDCFG when it should be overwriting?

**Issue:** Moab is appending qlist to a user via the IDCFG when it should be overwriting.

## **Symptom:**

Moab supports an identity manager via the IDCFG line where a flat text file or script use used to feed in user credential information to Moab. In such a case where the credential is:

user:john QLIST=test1

and it later changed to

user:john QLIST=test2

Moab appends the QLIST to the user crendential via mdiag -u.

## **Solution:**

Moab requires botht he QDEF and QLIST to be set at once in the identity manager.

So to get the desired behavior first set:

user:jbooth QDEF=test1 QLIST=test1

Then to change set to both QDEF and QLIST in the identidy manager.

user:jbooth QDEF=test2 QLIST=test2

Unique solution ID: #1056
