Torque

When using qsub -k what happens to the job output on the pbs_mom?

Issue: When using qsub -k what happens to the job output on the pbs_mom?

Solution:

With a -k the error and output are stored in /var/spool/torque/spool/ on the compute node for the duration of the job and then scped /cped back. This seemed to be the behavior even with $usecp.
