

# MAM

## What was resolved in the Moab Accounting Manager 9.1.0 release?

The following list are items that were resolved in Moab Accounting Manager v9.1.0 release:

- Events did not log notifications to the Notification table by default, as documented.
- MAM GUI sometimes failed after an RPM upgrade due to changed ownership of the GUI log file.
- Clients using the mamauth promotion method were intermittently returning an empty digest and signature causing the failure message "Incoming digest does not match calculated digest."
- Multi-chunk queries sometimes caused server to time out and client to hang
- An event alarm scoping problem resulted in client "Connection reset by peer" failures, and in rare occasions by server failure
- The systemd unit file did not use the correct sbin directory for ExecStart
